

MEZO Utilization Track

Borealis routes MUSD to the builders Mezo wants to grow.

Mezo's capital operations layer: governance signals come in, operators route MUSD across gauges, and every allocation is verified onchain.

The operations gap

Governance stops at the vote. Capital work starts after it.

Projects ask for support, MEZO holders signal priorities, and operators still need a clear way to route MUSD and prove the result.

The product

Borealis is the operations layer after governance.

Projects create gauges, MEZO-weighted signals rank priorities, and operators preview MUSD impact before executing a verifiable allocation.

Mezo testnet verification

A DAO records the vote. Borealis records the capital route.

Borealis exposes chain 31611, contract state, vote receipts, decoded allocation events, and explorer links inside the product flow.

Why Mezo should care

Borealis makes MEZO useful and MUSD measurable.

The same primitive supports liquidity campaigns, builder grants, validator incentives, and ecosystem budgets without a one-off spreadsheet process.

Continuation path

The ask: help turn Borealis into Mezo's allocation primitive.

We are asking for the MEZO Utilization prize, protocol feedback, and a path to pilot Borealis with real ecosystem allocation campaigns.

Borealis

MEZO-powered MUSD routing
